

G2Gx

User Guide

R1.0.0 January 6, 2007

www.forge43.com

Introduction

- **The problem**

- You need to plan a trip, expecting all the support and guidance you can get from your GPS device.
- However, most of the locations (waypoints), and most importantly, the route (path/track) itself, are not provided by your current GPS device.

- **The solution**

- Assuming that your GPS, may be connected on a computer, and get loaded new waypoints and tracks...
- ...then, you may prepare the spatial data on your computer, store them for later use, and just before commencing your trip, load them on your GPS device.

Introduction

continued...

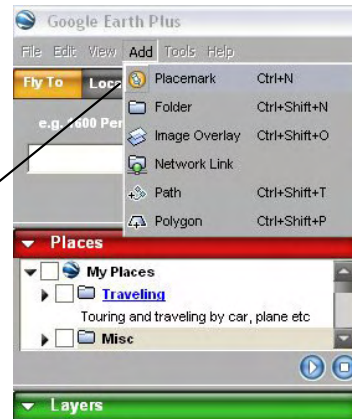

- **The process**

- There is a rich set of alternatives, on creating waypoints and paths on your computer. By the time, this is getting more and more easy, higher accuracy, and lower or zero cost.
- One of those alternatives, would be to use:
 - GoogleEarth Plus™ to assist you on identifying spatial information and creating the original digital information (data).
 - Your GPS manufacturer, PC-based software, to transfer your created data, onto your GPS device. In our example, this software is the MapSource™ by Garmin.

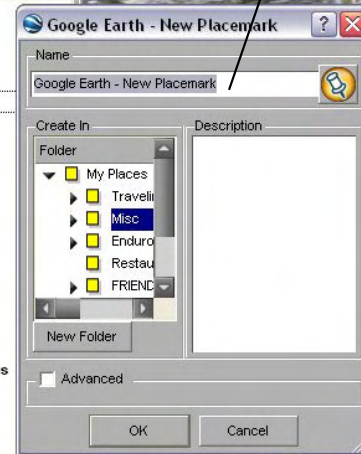

Create Waypoints in GoogleEarth

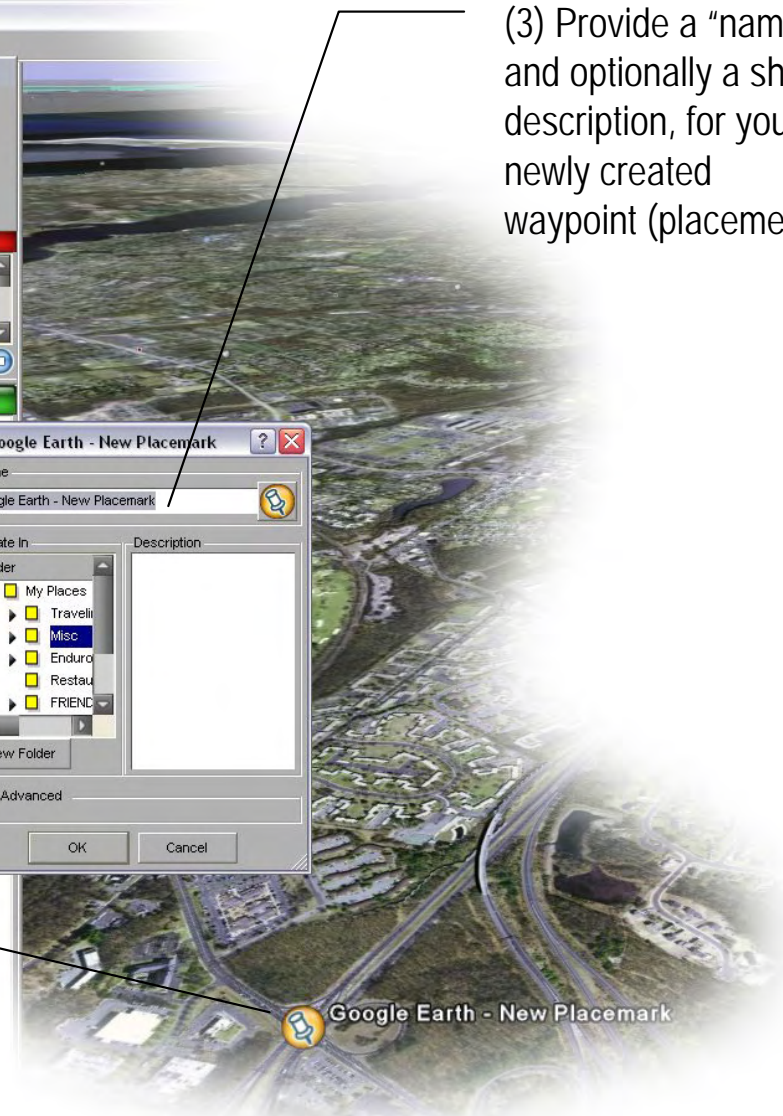

(1) Ask to "add" a "Placemark"
(i.e. waypoint)

(3) Provide a "name",
and optionally a short
description, for your
newly created
waypoint (placemerk)

(2) Pin your placemark on the
desire map location

Create Waypoints in GoogleEarth

Create another waypoint...

The image shows a screenshot of the Google Earth interface. On the left, the 'Places' and 'Layers' panels are visible. The 'Places' panel shows a folder named 'Misc' containing a waypoint labeled 'W01'. The 'Layers' panel shows various layers like 'terrain', 'Geographic Web', 'roads', and 'borders'. In the center, a 'New Placemark' dialog box is open, with the 'Name' field set to 'W02' and the 'Description' field set to 'mid junction'. The 'Create In' section shows a folder named 'Misc' selected. The background is a satellite map of a town, with a yellow pin labeled 'W02' placed at a road junction. A line points from the text 'Create another waypoint...' to the pin.

Create Waypoints in GoogleEarth

Proceed by defining all your desired waypoints...

Create a Path in GoogleEarth

(1) Ask to "add" a "Path"
(i.e. track or route)

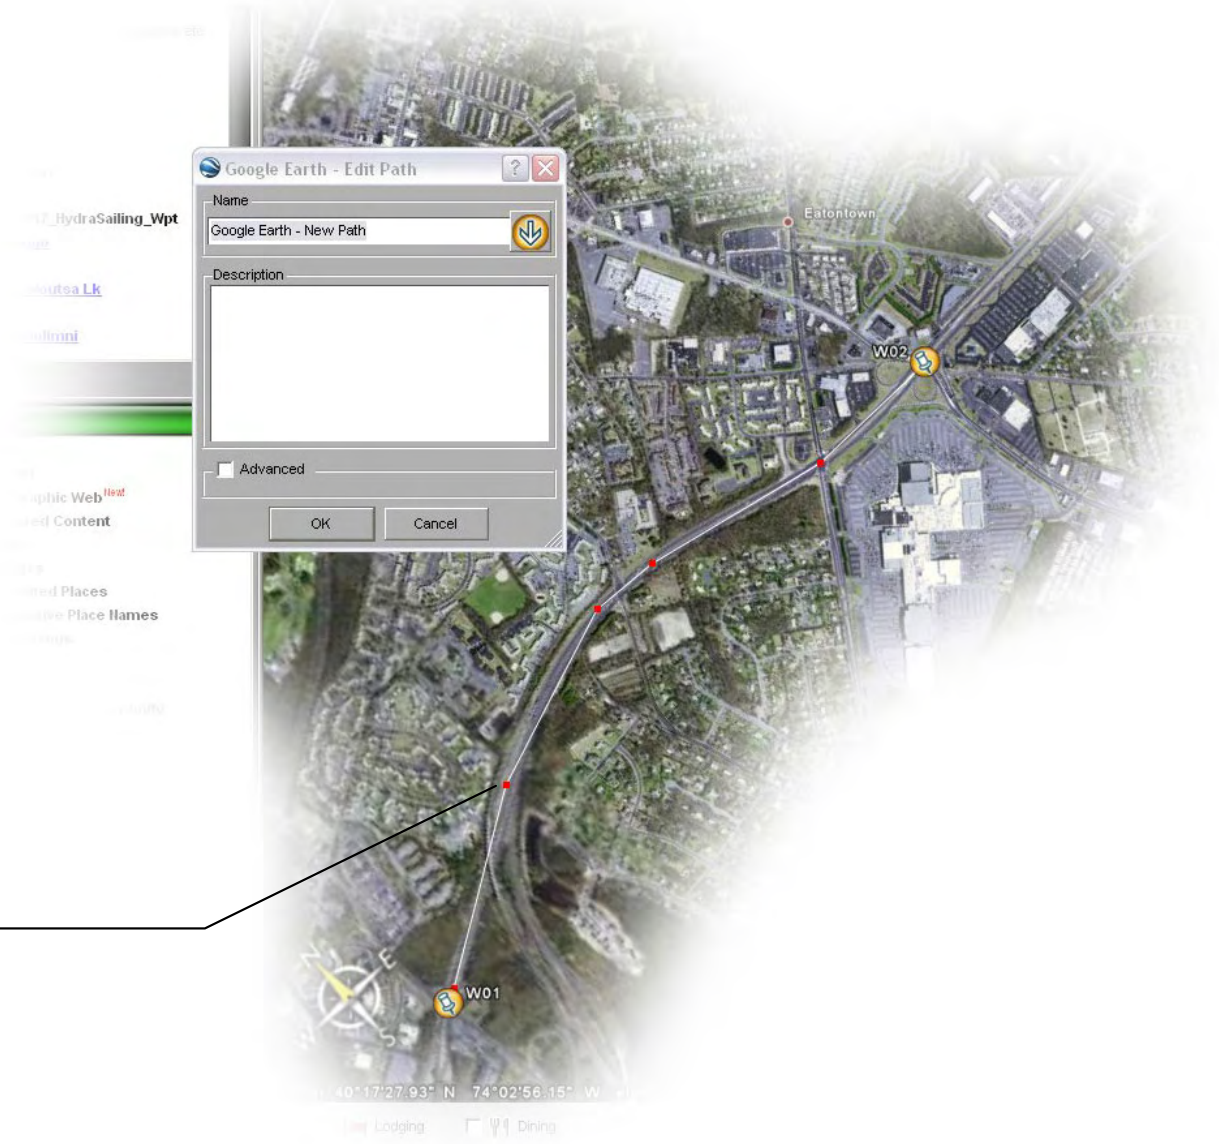

WARNING

The free version of GoogleEarth™ does not support "path" creation. This is supported by GoogleEarth Plus™, which is a subscription-based product by Google™.

Create a Path in GoogleEarth

(1) Draw your path
(piecewise linearized)

Create a Path in GoogleEarth

(1) Provide a "name",
and optionally a short
description, for your
newly created path.

Create a Folder in GoogleEarth

(1) Create a folder.
This folder will be used to accommodate
your newly created waypoints
(placemarks) and path(s).
Thus, position the cursor on "My Places",
right click and selected "Folder".

Create a Folder in GoogleEarth

Provide a "name", and optionally a short description, for your newly created folder.

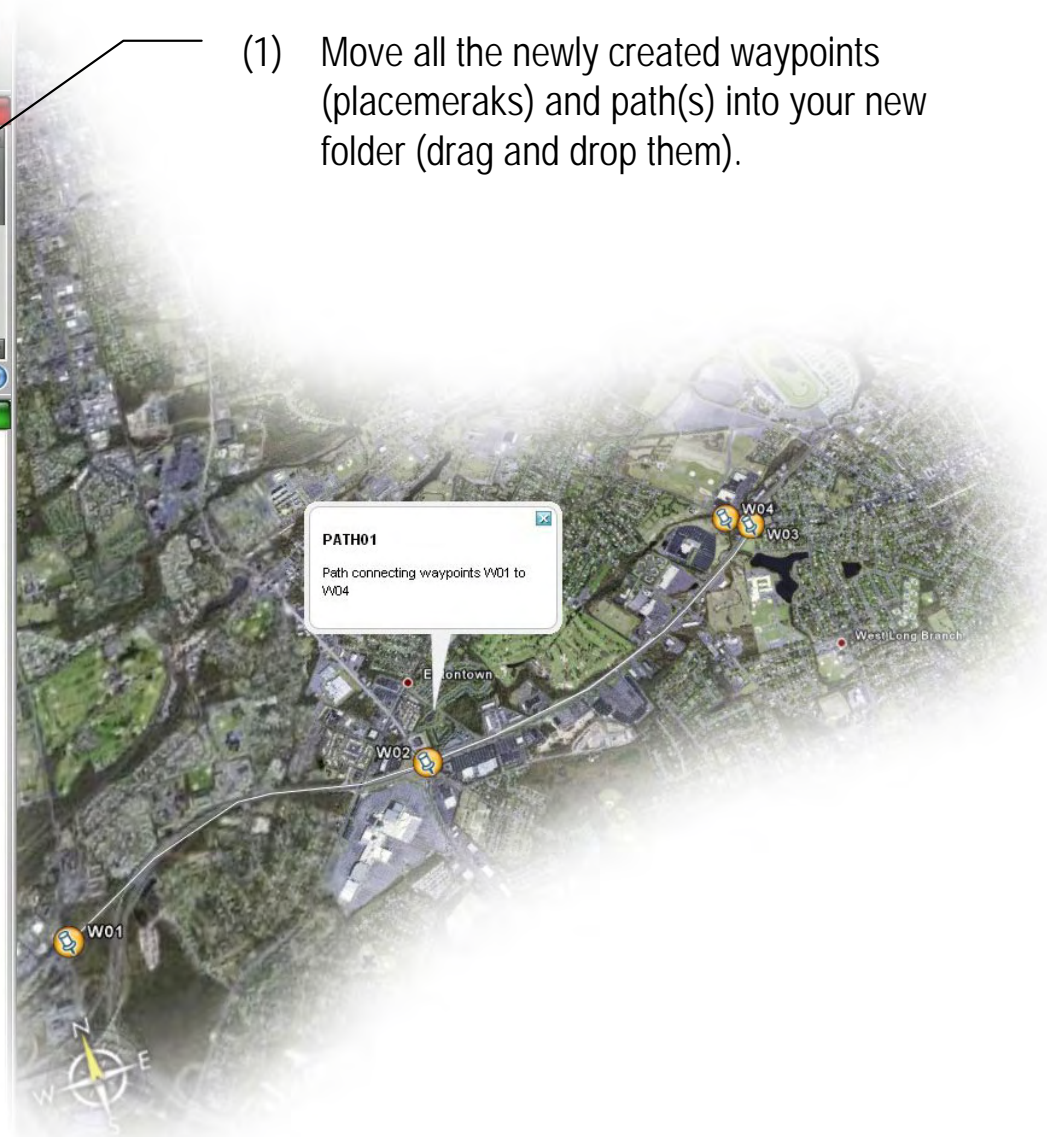

Move your spatial data in the folder

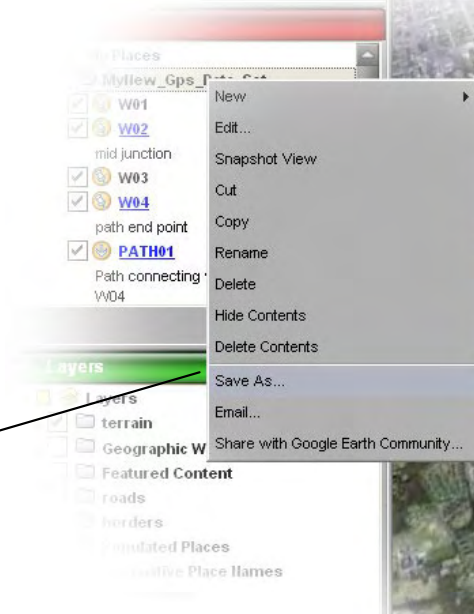

- (1) Move all the newly created waypoints (placemarks) and path(s) into your new folder (drag and drop them).

Export your data folder

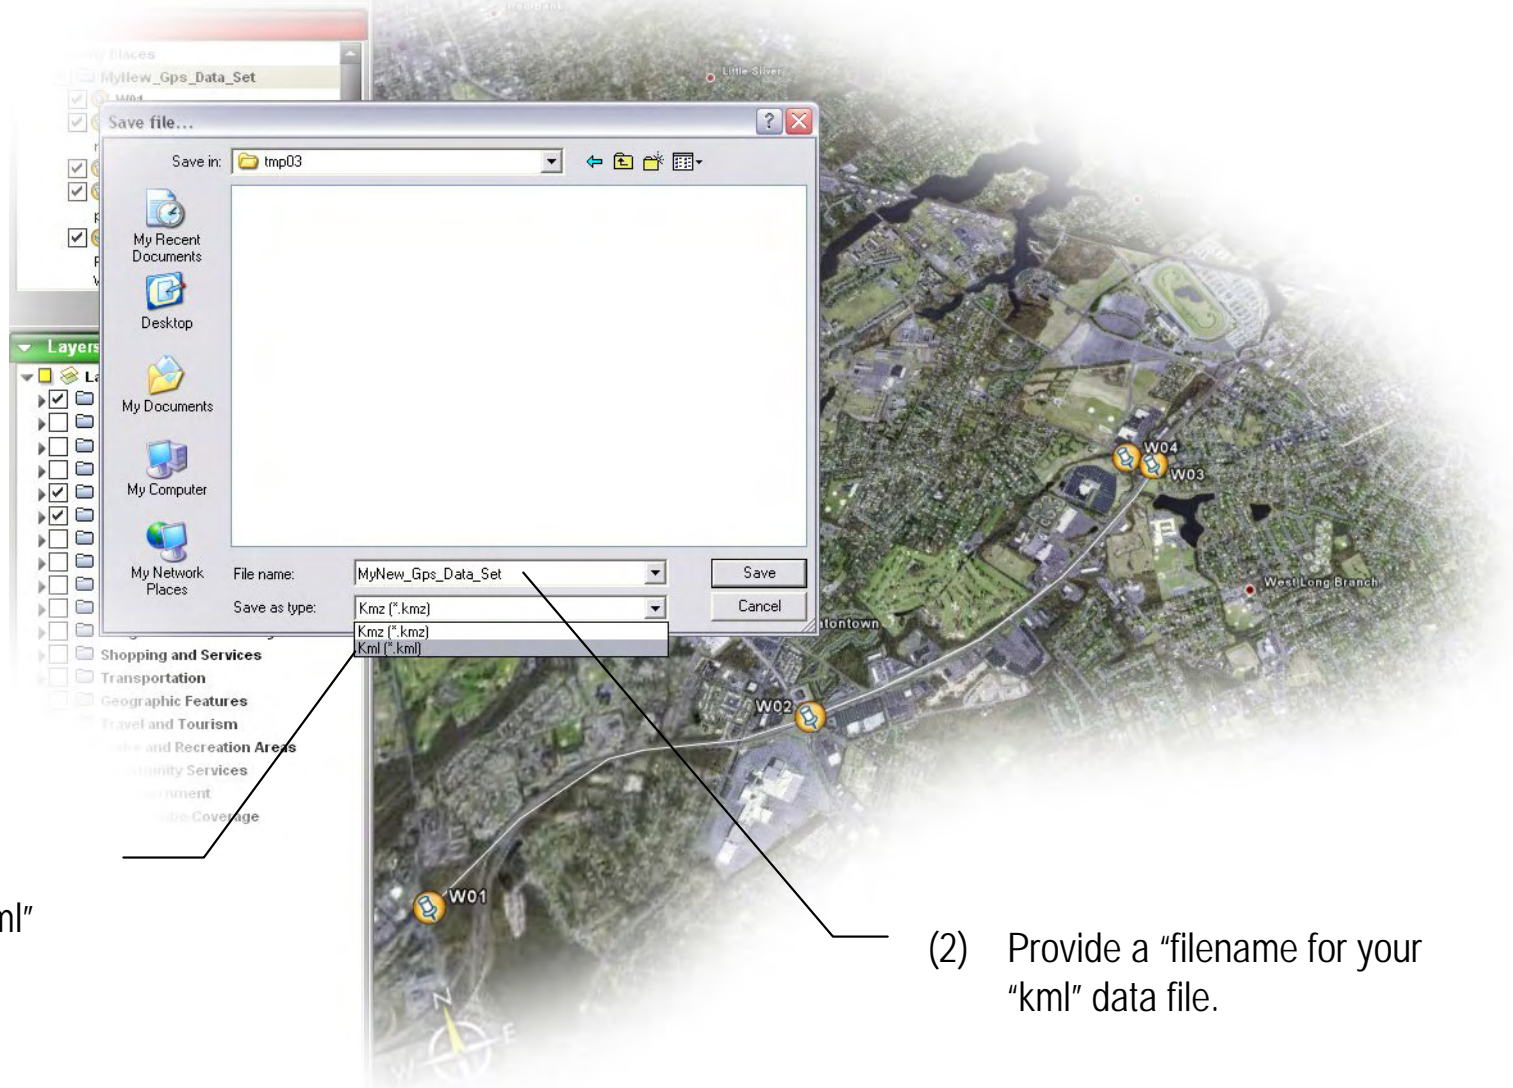

- (1) Time to "export" you data.
Thus, position the cursor on your newly created folde, right-click, and select "Save As..."

Export your data folder

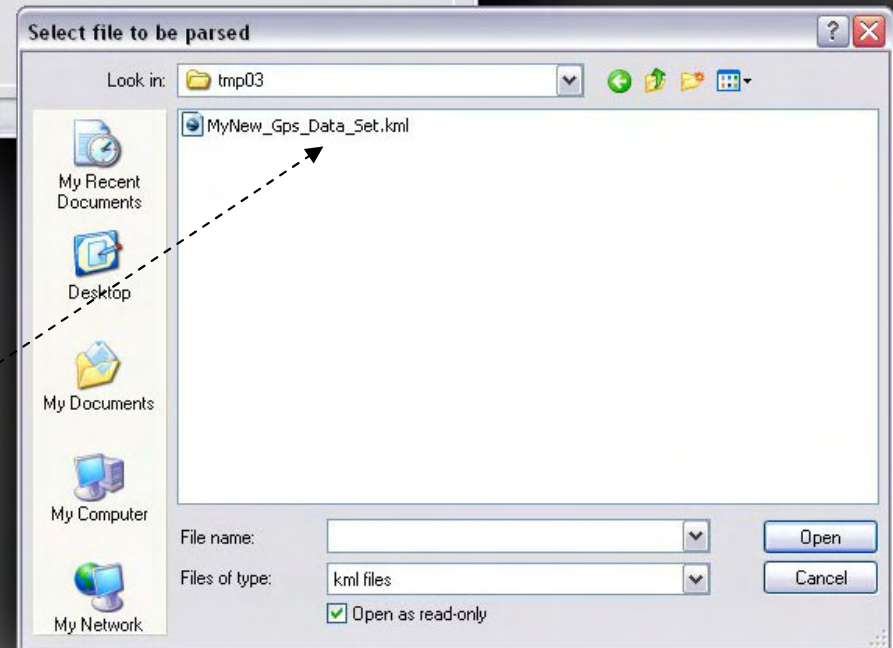

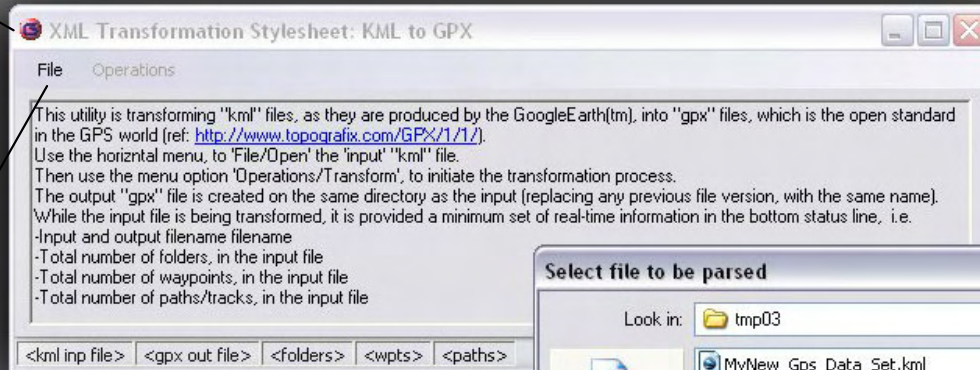

(1) IMPORTANT:
Select output file type "kml"

(2) Provide a "filename for your
"kml" data file.

Transform the GoogleEarth data file

(1) Now we need to convert the data, from the "kml" format, into the widely accepted "gpx" format. To perform this step, we run the "G2Gx" program.

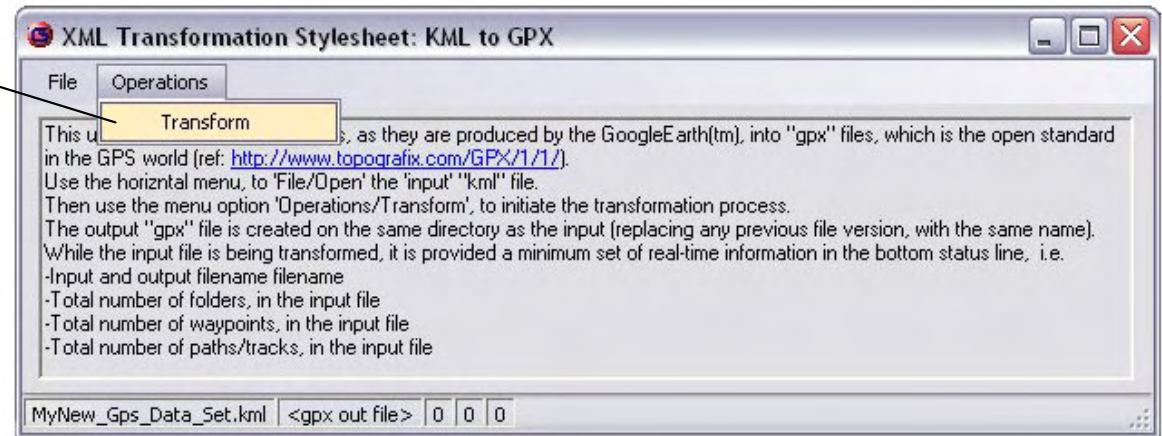

(2) We File/Open the recently created "kml" file

Transform the GoogleEarth data file

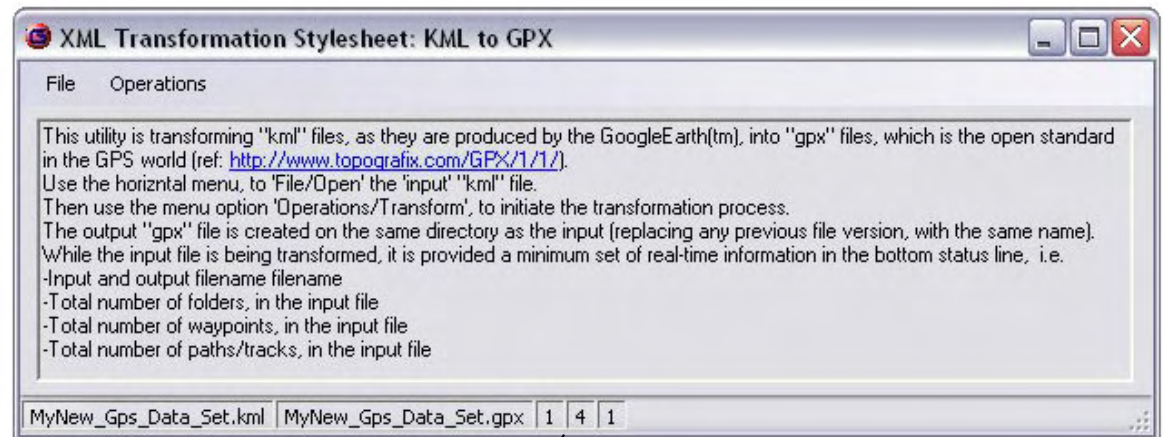

Initiate the transformation process, by selecting "Operations/Transform", from the horizontal menu.

(read the instructions, presented on the program window)

Transform the GoogleEarth data file

The transformation process, is producing a "gpx" file, on the same folder, where the input "kml" file was.

(Note: 1-4-1 in our example, means that the input "kml" file contained: 1-folder, 4-waypoints and 1-path)

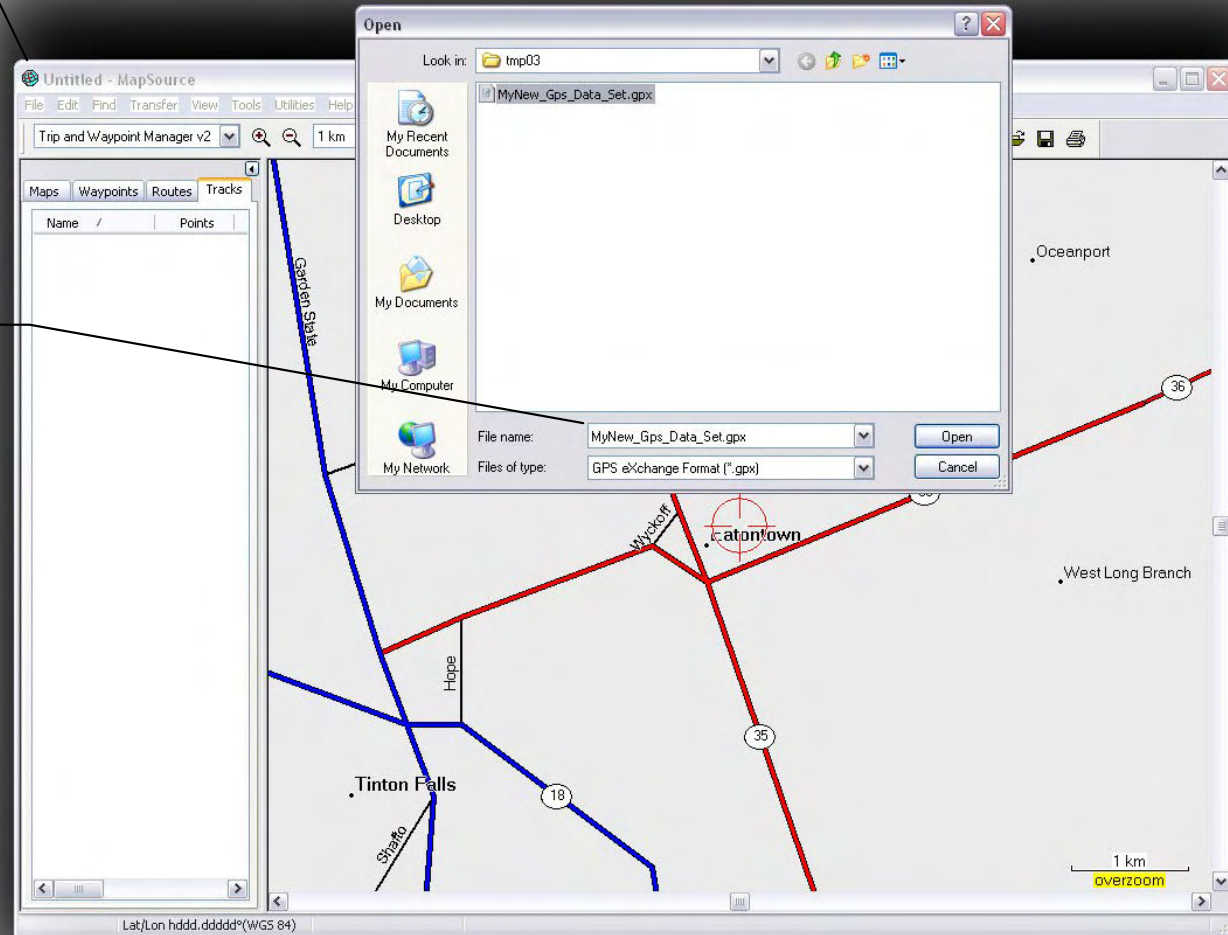

(read the instructions, presented on the program window)

Use the produced GPX data file

(1) Now we are ready, with our data in a "gpx" file. We may load the Garmin's MapSource™ utility...

(2) ...select "File/Open" and get our "gpx" data loaded...

Use the produced GPX data file

(1) As we observe, the data are loaded (the "path" is under the "tab" titled "Tracks", and the waypoints, are under the "tab" titled "Waypoints".

(2) Double-clicking on the path name (in our example "PATH01", we get a window opened, depicting our path segments in detail.

(3) Last, but not least, the program map is enhanced by depicting our own path, and all waypoints.

The screenshot shows the MapSource interface with a track named "PATH01" loaded. The "Track Properties" dialog box is open, displaying the following data:

Index	Leg Length	Leg Course	Position
1	620 m	57° true	N40.28734 W74.07823
2	588 m	71° true	N40.29034 W74.07207
3	211 m	93° true	N40.29209 W74.06553
4	581 m	102° true	N40.29198 W74.06305
5	432 m	90° true	N40.29085 W74.05636
6	463 m	84° true	N40.29087 W74.05127
7	666 m	80° true	N40.29127 W74.04585
8	633 m	68° true	N40.29231 W74.03812
9	224 m	60° true	N40.29442 W74.03119
10	508 m	57° true	N40.29543 W74.02890
11	210 m	50° true	N40.29795 W74.02391
12	57 m	33° true	N40.29916 W74.02201
13	178 m	304° true	N40.29959 W74.02165
14			N40.30048 W74.02339

The dialog box also shows summary statistics: 14 points, 5.4 km length, 1.0 sq km area, and a 1 km scale bar labeled "overzoom". The map background shows a network of roads and waypoints labeled W01, W02, W03, and W04.

Use the produced GPX data file

- (2) Double-clicking on a waypoint name (in our example "W01", we get a window opened, depicting our waypoint information in detail.

Note: The short description we used, when we originally created the waypoint, is now depicted in the field "Comment"

The screenshot shows the MapSource interface with a map of a region including locations like Tinton Falls, Hope, Eatontown, Wyckoff, Garden State, and West Long Branch. A red route is plotted with waypoints W01, W02, W03, and W04. A 'Waypoint Properties' dialog box is open for W02, showing the following details:

- Name: W02
- Symbol: [Square]
- Position: N40.29090 W74.05124
- Altitude: 0 m [Unknown]
- Depth: [Unknown]
- Proximity: [Unknown]
- Temperature: [Unknown]
- Comment: mid junction
- Display: Symbol & Name
- Date Modified: Unknown
- Link: [Empty]

The dialog box also includes 'OK', 'Cancel', 'Show On Map', and 'Fewer Details' buttons. The map shows a scale bar for 1 km and a '1 km overzoom' label.
